**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Binge drinking
Description	This element measures the percentage of the population that drinks more than five alcoholic beverages in one day, at least once per month. This measure is based on telephone survey sample data.
Percent of total health determinants score	10.0%
Data source(s)	Behavioral Risk Factor Surveillance System (BRFSS)
Year(s) of data used	1997-2003
Calculations and other notes	* Score truncated for calculation of summary scores and ranks.

Wisconsin	43.3
Mean of counties	31.1
Standard deviation	12.4

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Cancer risk due to inhalation of air pollutants
Description	This element measures the lifetime cancer risk due to inhalation of air pollutants based on EPA modeling of emissions.
Percent of total health determinants score	0.83%
Data source(s)	National Air Toxics Assessment, U. S. Environmental Protection Agency Online: http://www.epa.gov/ttn/atw/nata/
Year(s) of data used	1996
Calculations and other notes	Lifetime cancer risk is reported as “N” in a million likely cases due to a lifetime (70 years) of continuous exposure. The median value for each county was used. * Score truncated for calculation of summary scores and ranks.

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Cigarette smoking
Description	This element measures the percentage of the population that reports themselves to be current smokers or current occasional smokers. This measure is based on telephone survey sample data.
Percent of total health determinants score	6.0%
Data source(s)	Behavioral Risk Factor Surveillance System (BRFSS) Aurora Health Care, <i>Community Health Assessments</i>
Year(s) of data used	1997-2003 (BRFSS) 2003 (Aurora)
Calculations and other notes	<p>Aurora data were incorporated in the 13 counties for which data were available. The final estimates for these counties were weighted based on the BRFSS and Aurora sample sizes. These counties were: Brown, Door, Fond du Lac, Kenosha, Kewaunee, Manitowoc, Marinette, Oconto, Ozaukee, Sheboygan, Walworth, Washington, and Waukesha.</p> <p>* Score truncated for calculation of summary scores and ranks.</p>

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Divorce rate
Description	This element measures the percentage of adults in the population who report themselves to be divorced.
Percent of total health determinants score	13.3%
Data source(s)	United States Decennial Census Online: http://www.census.gov/
Year(s) of data used	2000
Calculations and other notes	We are continuing to look into the use of this measure in the rankings compared to a measure of the occurrence of new divorces in a county.

Population with at least a high school education

Wisconsin	N/A
Mean of counties	9.9
Standard deviation	1.2

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Fine particulate matter (< 2.5 micrometers; PM2.5)
Description	This element measures the amount of fine particulate matter in the air at monitoring sites throughout the state. Fine particulate matter has been linked to a variety of human health problems.
Percent of total health determinants score	0.83%
Data source(s)	Bureau of Air Management, Division of Air and Waste, Wisconsin Department of Natural Resources
Year(s) of data used	2000-2003
Calculations and other notes	<p>Three years of annual PM2.5 values were available from Wisconsin FRM (Federal Reference Method) monitoring sites in 18 counties between 2000 and 2003. For counties having more than one monitoring site, an average of the most recent county site values was used. Counties without measurements were assigned a value equal to the average of the counties within their region.</p> <p>** Estimated value</p>

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Health disparities
Description	The mortality rates (per 100,000 population) for those with a high school education or less were compared to those with at least some college education. As a measure of mortality disparity related to educational attainment, the ratio of rates for less educated vs. more educated were calculated for every county.
Percent of total health outcomes/determinants score	N/A
Data source(s)	Wisconsin death records 1996-2000 (unpublished data), Wisconsin Department of Health and Family Services, Division of Public Health, Bureau of Health Information and Policy United States Decennial Census (population education data) Online: http://www.census.gov/
Year(s) of data used	1996-2000 (deaths) 2000 (population education data)
Calculations and other notes	<ul style="list-style-type: none"> • Three age groups were used: 25-34, 35-44, 45-64, and the age adjustment was according to the (normalized) proportion of the Wisconsin population in these groups. • Sex adjustment weighted each sex equally. • The rate ratios are the mortality rate of county residents with a high school diploma/GED or less education in the ratio numerator divided by the mortality rates of county residents with more than high school diploma/GED (i.e., some college) in the denominator.

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	High school graduation rate
Description	This element measures the proportion of a cohort of students who graduate high school in four years.
Percent of total health determinants score	6.7%
Data source(s)	Wisconsin Department of Public Instruction Online: http://www.dpi.state.wi.us/spr/download.html
Year(s) of data used	2002-2003 school year
Calculations and other notes	<ul style="list-style-type: none"> • Numbers of graduates and dropouts for each school district within a county were pooled to calculate the county-level values. • Graduation rate = (# of graduates) / (# of graduates + # of cohort droupouts) • * Score truncated for calculation of summary scores and ranks

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Low fruit and vegetable consumption
Description	This element measures the percentage of the population that consumes less than 5 servings of fruits and/or vegetables per day. This measure is based on telephone survey sample data.
Percent of total health determinants score	3.0%
Data source(s)	Behavioral Risk Factor Surveillance System (BRFSS)
Year(s) of data used	1997-2003
Calculations and other notes	* Score truncated for calculation of summary scores and ranks.

**Detailed methods for the use of water quality
in the Wisconsin County Health Rankings – 2004**
Matt Landis

Introduction

There are two underlying tenants that support our application of nitrates in the drinking supply as a public health indicator: first, nitrates present over the preventative action level is a marker of increased risk to even higher levels of nitrates, other chemical seepages (pesticides like triazines), and fecal coliforms. Second, the many data points available for nitrates in both public and private sources make it an excellent candidate to add to the County Ranking. We performed two separate rankings for nitrates, one for all nitrate detects greater than 2mg/L, the limit in accordance with the Preventative Action Level, and also for nitrate detects greater than 10mg/L, the limit in accordance with the Enforcement Standard. This yields two separate measures of nitrates, one focusing on the overall county population, and another focusing on private well water, where the majority nitrate levels above 10mg/L are detected. Municipal water supplies take multiple measurements throughout the year, and in no instance was the average of measurements over a single year exceeding this Enforcement Standard.

Methods

Data Attainment

County population data is gathered for all WI counties using 2000 Census Information. All data was accessed through the WI DNR Drinkingwater and Groundwater homepage.

Private well data was compiled using the Groundwater Retrieval Network, specifically the “Sample Analytical Data – Summary Count Report.” Blocks of 5 counties were selected in each run, as well as dates for 2003; and Nitrates were selected as the contaminant type (http://prodmtext00.dnr.state.wi.us/pls/inter1/pk_wr583_sample_summary.p_summary_search).

Public or municipal wells were compiled using the Contaminants in Public Water Supply Database, selecting blocks of 5 counties for each data run. Additional fields modified include date field to limit retrieval to 2003 data, the sample type field was selected for compliance only, and nitrate was chosen as the DNR sample group ([http://prodmtext00.dnr.state.wi.us/pls/inter1/pws29\\$.startup](http://prodmtext00.dnr.state.wi.us/pls/inter1/pws29$.startup)). Population served by the municipal water source was selected as an additional field to download.

County population information was ascertained using the 2000 census report (http://factfinder.census.gov/home/saff/main.html?_lang=en).

Data Analysis

Private Water Supply

a) given # wells sampled, # wells exceeding the Preventative Action Limit (PAL, 2mg/L), and # wells exceeding the Enforcement Standard (ES, 10mg/L).

NOTE: storet code 630+620, the measurements coinciding with municipal sources, is used for all counties.

b) denominator = # wells sampled = 630+620 totals;

numerator = # wells in exceedence = PAL620 + PAL630 + ES620 + ES630

c) Proportion of tested wells in exceedence = numerator/denominator

EXAMPLE: Adams County

Storet Code	Storet Description	# Wells With Samples	# Wells With Detects	# Wells Exceeding ES	# Wells Exceeding PAL	Max Detection Level
620	NITROGEN NO3-N TOTAL	353	322	19	123	35
630	NITROGEN NO3+NO2	989	767	109	354	48.4

Numerator = 19+123+109+354 = 605

Denominator = 353+989 = 1342

% wells with unhealthy levels = 605/1342 * 100 = 45.082% private well tests in Adams County in 2003 have unhealthy levels of nitrates in the water supply.

Similarly, % of wells exceeding the Enforcement Standard of 10mg/L was also calculated, with the numerator simply being ES620 + ES630. This is explained in detail below.

Municipal Water Supply

a) given nitrate concentration (mg/L) and population served for all municipal sources, by county
 b) stratify concentrations as either above or below PAL (2mg/L), turning municipal supply into categorical variable.

c) Numerator = municipal population served by wells over PAL

Denominator = total county population (from 2000 census)

d) Overall, a municipal source either had a level over 2mg/L or did not have a level over 2. On average a municipality did not exceed 10mg/L for a given year. When there was uncertainty over many measurements, the average concentration determines whether or not the municipality is above or below PAL.

NOTE: In 2003 no municipal source had an average concentration exceeding 10mg/L.

Example:

Adams County

Contaminant	Measured Amount mg/L	System Name	Population
NITRATE (N03-N)	0.17	ADAMS WATERWORKS	1819
NITRATE (N03-N)	0.88	ADAMS WATERWORKS	
NITRATE (N03-N)	2.2	FEDERAL CORRECTIONAL INSTITUTION	1550
NITRATE (N03-N)	0.97	FEDERAL CORRECTIONAL INSTITUTION	
NITRATE-NITRITE (N03+N02)	0.54	ROME WATER UTILITY	2775
NITRATE-NITRITE (N03+N02)	7.09	ROME WATER UTILITY	

NITRATE-NITRITE (N03+N02)	7.43	ROME WATER UTILITY
NITRATE-NITRITE (N03+N02)	6.31	ROME WATER UTILITY
NITRATE-NITRITE (N03+N02)	6.29	ROME WATER UTILITY

Adams waterworks is below, Rome is above, Federal Corrections is below: $(2.2+0.97)/2 = 1.59$

Therefore: Population affected = 2775

Using 2000 census data, we find the percent total population affected by municipal exceedence is $2775/18,643 = 0.1488 = 14.8\%$ of the total population is affected by municipal exceedence.

Overall County Measurement

To arrive at an overall measure of the percentage of a county's population exposed to levels of nitrates exceeding the Preventative Action Limit and Enforcement Standard, the following equation is used:

$$\frac{[(\text{Private pop} * (\% \text{ wells} > 2))]}{2000 \text{ population county total}} + \frac{(\text{Exposed Municipal pop})}{2000 \text{ population county total}} = \% \text{ Pop at Risk}$$

The private well population is defined as the difference between the 2000 Census county population total and the municipal population given by the DNR. After calculating the percent county population exposed to levels greater than the Preventive Action Limit for all counties, the counties are ranked on percent at risk and incorporated into our overall ranking system.

Similarly, a second measure of nitrates present over the Enforcement Standard of 10mg/L is also produced, weighted by population as above. On average, the number of municipalities exceeding 10mg/L was small, and therefore only private wells exceeding this standard is used. Both measures are incorporated with equal weights into the county ranking. This is achieved for all counties except Menominee County, for which data is not available as the DNR does not report monitored levels publicly or privately.

a) Private Well Population = 2000 Census Pop – Municipal Pop

b) To arrive at the measure of the percentage of a county's population exposed to levels of nitrates exceeding the Preventative Action Limit and Enforcement Standard, the following equation is used:

$$\left[\frac{(\text{Private pop})}{2000 \text{ population county total}} * (\% \text{ wells} > 2) \right] + \frac{(\text{Exposed Municipal pop})}{2000 \text{ population county total}} = \text{Total Exposed Pop}$$

Example:

Adams county total population: 18,643 (from 2000 census)

Private pop = 18,643 – 6144 = 12,499

% population at risk = $[(12,499/18,643)*0.45082] + 2,775/18,643 = 0.4511 = 45.11\%$ of the Adams County population is exposed in 2003 to nitrate levels at or above the preventative action limit.

A similar Overall Measurement was taken by county for wells exceeding the Enforcement Standard of 10mg/L, a second tier of risk that focuses on private wells as the primary source of drinking water. On average, municipal sources did not exceed 10mg/L, and therefore municipal sources did not contribute to this aspect of the ranking.

Example:

Adams county private population = 12499

Numerator = 19+109 = 128

Denominator = 353+989 = 1,342

% wells exceeding the ES = $128/1,342 = 0.0953$

% population at risk = $(12,499/18,643)*(0.0953) = 0.0639$

Therefore, 6.39% of the Adams County population at risk for exposure to nitrates above 10mg/L

We ranked counties by the overall measurement exceeding 2mg/L and also exceeding 10mg/L, weighted by percentage of urban and rural population. This provided two different rankings, and both counted equally into the composite nitrate measurement.

Overview of Methods

I. Selection of population health measures

We focus on two categories of health measures—health outcomes and health determinants. Outcomes are intended to measure the current state of health in a county, while determinants are viewed as predictors of future health outcomes. Twenty-three measures of health outcomes and determinants were selected using the following criteria:

- the measure is a direct or proxy measure of an important aspect of population health;
- the data are reasonably valid;
- the data are publicly available;
- the data are available at the county-level;
- the data are current and updated periodically.

Health Outcomes: two components were used to represent health outcomes: death and health status while alive. Death and health status are each assessed with a single measure (years of potential life lost and self-reported health status). While much more specific health outcomes could be included here, these two address both length and quality of life.

Health Determinants: the selection of determinant measures was largely guided by the Wisconsin state health plan priorities. However, we do not include measures that represent specific diseases. We divided the 21 health determinant measures into four major components: health care, health behaviors, socioeconomic factors related to health, and the physical environment. Each of these four major components is comprised of multiple health measures.

II. Data sources

The figure on page 3 lists the outcomes and determinants components and their associated health measures. The data used for this report came from a variety of sources:

- **Complete population** (non-sample), annually available data. These data include vital statistics (mortality/YPLL, teen births, smoking during pregnancy) and were obtained from the Bureau of Health Information and Policy, Division Public Health, Wisconsin Department of Health and Family Services and the U.S. Centers for Disease Control and Prevention (CDC) WONDER database.
- **Census data:** based on near-complete population or large-sample decennial data (education level, income, divorce rate, and year housing structure built). These were obtained online from the U.S. Census Bureau.
- **Sample survey data:** based on moderate-sized annual samples primarily from the U.S. Centers for Disease Control and Prevention’s Behavioral Risk Factor Surveillance System (cigarette smoking, physical inactivity, overweight and obesity, low fruit and vegetable consumption, and binge drinking) or the Wisconsin Department of Health and Family Service’s Family Health Surveys (no health insurance, did not receive needed health care, and no recent dentist visit). These data are often quite sparse for some counties and were obtained from the Bureau of Health Information and Policy.
- **Other data** were obtained from the Wisconsin Department of Health and Family Services, Wisconsin Department of Natural Resources, Wisconsin Department of Public Instruction, Wisconsin Office of Justice Assistance, the U.S. Environmental Protection Agency, and Aurora Health Care’s *Community Health Assessments*.

The specific time periods and sources corresponding to each health measure are further detailed on the Wisconsin Public Health and Health Policy Website (see the end of this section).

Overview of Methods continued

III. Rankings

Each of the 2 health outcomes measures and 21 health determinants measures were estimated for each county (often averaging over years). The mean and standard deviation of each of the health measures were calculated across the 72 counties. Counties were then given a “score” for each measure. This score was the number of standard deviation units that the county was from the mean of all the counties. To avoid a county’s rank being strongly influenced by one extreme component score, we truncated the score at (-3.0) or (3.0) if the actual score fell outside of this range. Weighted averages of the (truncated) scores were used to calculate the overall summary outcomes and determinants rankings and the rankings for the four major categories of determinants. The weights used for the components to calculate summary outcome and determinant rankings are given in the figure on page 3.

IV. Changes from the *Wisconsin County Health Rankings—2003*

The annual production of the *Wisconsin County Health Rankings* provides us the opportunity to incorporate improvements from the previous year’s document. Based on feedback received after the 2003 edition, discussion and advice from groups in many fields, and continued investigation into available data sources, a number of changes have been made for this year’s edition.

- **County-level estimates:** In cases of low-population, counties were previously grouped together and a county-specific estimate was calculated by combining both county-level and county-group-level data. This approach effectively reduced random error in the county-specific estimates, but at the expense of using data from outside the county to estimate within-county measures. For the current edition we have eliminated this procedure and instead combined additional years of data, when possible, to increase sample sizes. In this way, we prevent neighboring counties with very different levels of health from influencing county-level estimates.

• Data elements

- **Mortality:** Years of potential life lost (YPLL) is measured prior to 75 instead of 85 years of age as in the previous edition.
- **Health care (previously “access to health care”):** “No recent blood pressure check” has been removed from the rankings because it has not been included as a question in recent Behavioral Risk Factor Surveillance System surveys.
- **Health behaviors:** Violent crime has replaced firearm deaths.
- **Socioeconomic factors:** In addition to Census 2000 data on the level of educational achievement of the general population, we have added the current high school graduation rates.
- **Physical environment:** Percent of children tested who were positive for lead poisoning has been joined by an additional measure to strengthen the estimate of lead danger (pre-1950s housing), as well as estimates of water (nitrate levels) and air (pollution data) quality.

A more detailed methods description, as well as county-level component values, can be found on the Wisconsin Public Health and Health Policy Institute website: www.pophealth.wisc.edu/wphi/.

Wisconsin YPLL	6334
Mean of counties	6589
Standard deviation	1602

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Years of potential life lost prior to age 75 (YPLL-75)
Description	This is an indicator of county mortality that accounts for the age at which a person dies—persons who die at a younger age are considered to have lots more “potential” years of life. For example, persons who die at age 65 are considered to have lost 10 “potential” years of life. Children who die at age 10 are considered to have lost 65 “potential” years of life. For each county, all years of potential life lost are summed over the relevant time period and the YPLL is then estimated on a “per 100,000 persons” basis.
Percent of total health outcomes score	50%
Data source(s)	Centers for Disease Control and Prevention Wonder Database, Mortality – underlying cause of death Online: http://wonder.cdc.gov/
Year(s) of data used	1999-2001
Calculations and other notes	YPLL-75 is age-adjusted to the U.S. 2000 age distribution. * Score truncated for calculation of summary scores and ranks.

NOTE: The above data contains minor modifications compared to those used in the 2004 Wisconsin County Health Rankings.

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Did not receive needed health care
Description	This element measures the percentage of the population that did not get needed health care (medical care or surgery) in the twelve months prior to being interviewed. This measure is based on telephone survey sample data.
Percent of total health determinants score	3.3%
Data source(s)	Family Health Survey (FHS)
Year(s) of data used	1997-2003
Calculations and other notes	NOTE: Minor modifications have been made to these data since the construction of the 2004 county rankings to correct a detected error. While the rank for some counties may have been slightly altered, the overall impact was very small. The component data presented here have been corrected.

Wisconsin	6.4%
Mean of counties	7.5%
Standard deviation	3.3%

NOTE: The above data contains minor modifications compared to those used in the 2004 Wisconsin County Health Rankings.

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	No health insurance
Description	This element measures the percentage of the population without health care coverage of any kind, including prepaid plans, HMOs, or government plans such as Medicare. This measure is based on telephone survey sample data.
Percent of total health determinants score	3.3%
Data source(s)	Family Health Survey (FHS)
Year(s) of data used	1997-2003
Calculations and other notes	NOTE: Minor modifications have been made to these data since the construction of the 2004 county rankings to correct a detected error. While the rank for some counties may have been slightly altered, the overall impact was very small. The component data presented here have been corrected.

Wisconsin County Health Rankings – 2004
Technical Notes

Data element	Obesity
Description	This element measures the percentage of the population that has a body mass index (weight in kg divided by height ² in m ²) greater than or equal to 30 kg/m ² . This measure is based on telephone survey sample data.
Percent of total health determinants score	3.0%
Data source(s)	Behavioral Risk Factor Surveillance System (BRFSS) Aurora Health Care, <i>Community Health Assessments</i>
Year(s) of data used	1997-2003 (BRFSS) 2003 (Aurora)
Calculations and other notes	Aurora data were incorporated in the 13 counties for which data were available. The final estimates for these counties were weighted based on the BRFSS and Aurora sample sizes. These counties were: Brown, Door, Fond du Lac, Kenosha, Kewaunee, Manitowoc, Marinette, Oconto, Ozaukee, Sheboygan, Walworth, Washington, and Waukesha.

Overweight (Body mass index $\geq 25\text{kg/m}^2$)

Wisconsin	N/A
Mean of counties	75
Standard deviation	8

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Ozone
Description	This element measures the amount of ozone present at air monitoring sites throughout the state. Ozone has been linked to a variety of human health problems.
Percent of total health determinants score	0.83%
Data source(s)	Bureau of Air Management, Division of Air and Waste, Wisconsin Department of Natural Resources
Year(s) of data used	2001-2003
Calculations and other notes	<p>The 2001-2003 “annual average 4th highest peak daily running 8-hour ozone values” were available from Wisconsin DNR ozone monitoring sites in 29 counties. Counties without measurements were assigned a value equal to the average of the counties within their assigned region.</p> <p>* Score truncated for calculation of summary scores and ranks.</p> <p>** Estimated value</p>

**Wisconsin County Health Rankings – 2004
Technical Notes**

Data element	Percent of sample reporting “fair” or “poor” health
Description	The percent of the population that reports fair or poor health is used as a measure of general health status. The data are based on answers to the question, “In general, would you say that your health is excellent, very good, good, fair, or poor?” The percentage of persons reporting less-than-good health (i.e., fair or poor) is detailed here.
Percent of total health outcomes score	50%
Data source(s)	Behavior Risk Factor Surveillance System (BRFSS) Family Health Survey (FHS)
Year(s) of data used	1997-2003
Calculations and other notes	<p>Age-adjusted prevalences for BRFSS and FHS were calculated separately using 4 age groups: 18-34, 35-44, 45-64, 65+. A weighted average of the BRFSS and FHS prevalences was then calculated based on the sample size of each survey.</p> <p>Note: The method of age-adjustment above is different from that used for the 2003 Rankings and may have influenced a slight increase in the reported value for prevalence of fair/poor health.</p>

Smoking during pregnancy
